Version 1 11th April 2021

Introduction

This is a living document that will be continuously edited and updated as understanding of the (COVID-19) virus improves and government guidance changes.

SARS-CoV-2 is a respiratory virus that can invade a host via the respiratory route or via hand to eye/mouth/nose contact, causing the disease COVID-19.

People who may appear healthy may be carrying and shedding the virus, which can be passed on either directly or indirectly to others. This means that we need to assume that anyone could be carrying the virus.

The virus can be transmitted by:-

- direct contact to face (ie. eyes, nose from droplets or aerosols spraying from an infected person onto another person who is in close contact).
- Contamination via droplets from sneezing and coughing landing on surfaces and then transferring via hands onto eyes, nose and mouth. Other means of secretions getting onto surfaces could be from people touching their eyes, nose and mouth and then touching surfaces with contaminated hands.
- contaminated hands of infected people can transfer the virus directly to others (eg. handshakes) or onto hand contact surfaces which can be picked up by other people's hands and transferred to their eyes, nose or mouth.
- possible transmission from faeces to hands and then directly or indirectly to the body via hands and hand contact surface transfer.

The main controls are:-

- social distancing with government guidelines
- disinfecting hand contact surfaces.
- hand washing and hand sanitiser use at key moments.
- not touching eyes, mouth or nose with contaminated fingers.
- wearing a face covering inside all public areas at all times unless sat at a table
